General

In our product range on refractories you can find a wide variety of shapes and sizes i.e. Pressed Batts 1000 x 1000 mm, Extruded Batts up to 1800 x 840 mm and Circular Discs up to 1092 mm dia.

We offer a range of designs to suit your individual needs and accessories such as props, caps, beams and fittings combine to allow a complete support system to be assembled.

The refractories for the SC-TOP series has carefully been selected to make sure that we meet the demands as for quality and usability. Each kiln model is delivered with a refractory set including batts, tubes and batt wash. The refractory sets are adapted to fit the size of the kiln (the picture above is only showing a typical set), see next page.

Refractory set SC-Kilns

SC TOP 020 - SC200

The refractory sets for the SC-kilns series are produced in a good general-purpose material (cordierite-mullite) with reasonable resistance to thermal shock and good cold strength. It is not recommended for use under heavy loads at high temperatures above 1300 °C or in very fast-firing kilns.

Normally the batts will bend at the high temperatures and should be repeatedly flipped to remain straight.
Note! Do not use bended batts in your production.

It is recommended to apply the Batt wash, a protective coating for kiln batts (also included in the sets), to protect the batts from dripping glazes during firing. Mix the powder with water to a creamy consistency and apply with a brush.
